

1. A majority of the subject property drains through a existing ditch into the corner of my property. We are concerned about the silt from the construction grading coming onto our property.
2. The company contracted to do the test drilling drove their machine through the blue line stream causing damage to the creek and damming up water which is now backing up on our property during rain events. How do they plan on accessing the site with large equipment and not causing more damage to the existing creek?
3. The proposed road from Ball Rd is too close to the property line in our opinion. Our house and child's play area are close to that property line and we believe the road should be moved to the center of the open field and not so close to us. We are concerned about our privacy and our child's safety with the road being that close to us. We do not want anyone using the road to be able to easliy see in our side windows of our residence.

See attched pictures.
