INTRODUCTION

Wilbur Smith Associates (WSA) is pleased to submit this report to address any traffic impact and access of a residential development located on Stanley Road in north Knox County. The basis for this study required the collection of traffic data, generation of anticipated traffic volumes for the proposed site and development of projected traffic volumes for normal growth and from the potential site. Analyses of the resulting traffic projections were conducted to determine the capacity and levels of service for the site access to Stanley Road and Clinton Highway (US 25W). This study will evaluate the development's impact and determine if any mitigation measures are necessary to minimize the traffic impact including improved roadway geometrics and traffic control devices.

Project Description

The proposed project is a residential development. The development is 75 single-family units on approximately 23.75 acres. The site access is to Stanley Road from a proposed residential street. Figure 1 shows the proposed site plan.

Site Location

The location of the proposed residential development is north side of Stanley Road and west of Clinton Highway (U.S. 25W) in north Knox County, Tennessee, near Anderson County. Figure 2 illustrates the site location relative to local and regional access.

Figure 2

LOCAL AND REGIONAL ACCESS

Local Access

The proposed local access is to Stanley Road. The adjacent street facility is approximately 18-feet in width and extends between Clinton Highway (U.S. 25W) and Old Clinton Pike to the north of the site in Anderson County. Stanley Road has an estimated 2007 average daily traffic (ADT) of 1,195.

Regional Access

Regional access to this site is from Clinton Highway (US 25W) accessed to the east of the site or north of the site. Clinton Highway extends northwest into Anderson County and southeast into Knoxville. Interstate 75 is east of the site and can be accessed using Emory Road (SR 131) which intersects Clinton Highway to the + south. Clinton Highway extends southeast where it intersects the I-75 and I-640 interchange.

Interstate 640 connects to I-40 east and west of the Knoxville CBD and becomes I-75 to the west. Interstate 640, east of Clinton Highway, has a 2006 ADT of 38,660. Interstate 40 is an east and west facility extending between Nashville, Tennessee, and Asheville, North Carolina. The approximate 2003 ADT for I-40/75 west of I-640 is 152,130. To the east of I-640, I-40 has an ADT of 101,080. Interstate 75 extends north to Lexington, Kentucky, and to the west, I-75 turns south to Chattanooga, Tennessee.

EXISTING TRAFFIC CONDITIONS

Existing Traffic Control and Speed

Street approaches to Stanley Road in the project vicinity are STOP controlled. The posted speed limit for Stanley Road is 30mph.

Existing Traffic Volumes

WSA conducted turning movement count for the intersections of Stanley Road at Clinton Highway and Grand Oak subdivision in November 2007. The AM and PM peak hours are found between 7:00 to 8:00a.m. and 5:00 to 6:00p.m. Figure 3 illustrates the AM and PM peak-hour traffic volumes at the proposed intersection location of the proposed residential street.

Existing Capacity and Level of Service

In order to evaluate the current operations of the traffic control devices, capacity and level of service were calculated using the 2000 Highway Capacity Manual, Special Report 209 published by the Transportation Research Board (TRB). Signalized and unsignalized intersections are evaluated based on estimated intersection delays, which may be related to level of service (LOS).

Level of service and capacity are the measurements of an intersection's ability to accommodate traffic volumes. Levels of service for intersections range from A to F. LOS A is the best, and LOS F is failing. For signalized intersections, a LOS of A has an average estimated intersection delay of less than 10 seconds, and LOS F has an estimated delay of greater than 80 seconds. A LOS of C and D are typical design values. Within urban areas, a LOS D, delay between 35 and 55 seconds, is considered acceptable by the Institute of Transportation Engineers (ITE) for signalized intersections.

Unsignalized intersection levels of service have lower thresholds of delays. A LOS of F exceeds estimated delays of 50 seconds. For urban arterials, minor approaches may frequently experience levels of service E. A full level of service description for unsignalized intersections is presented in Tables 1.

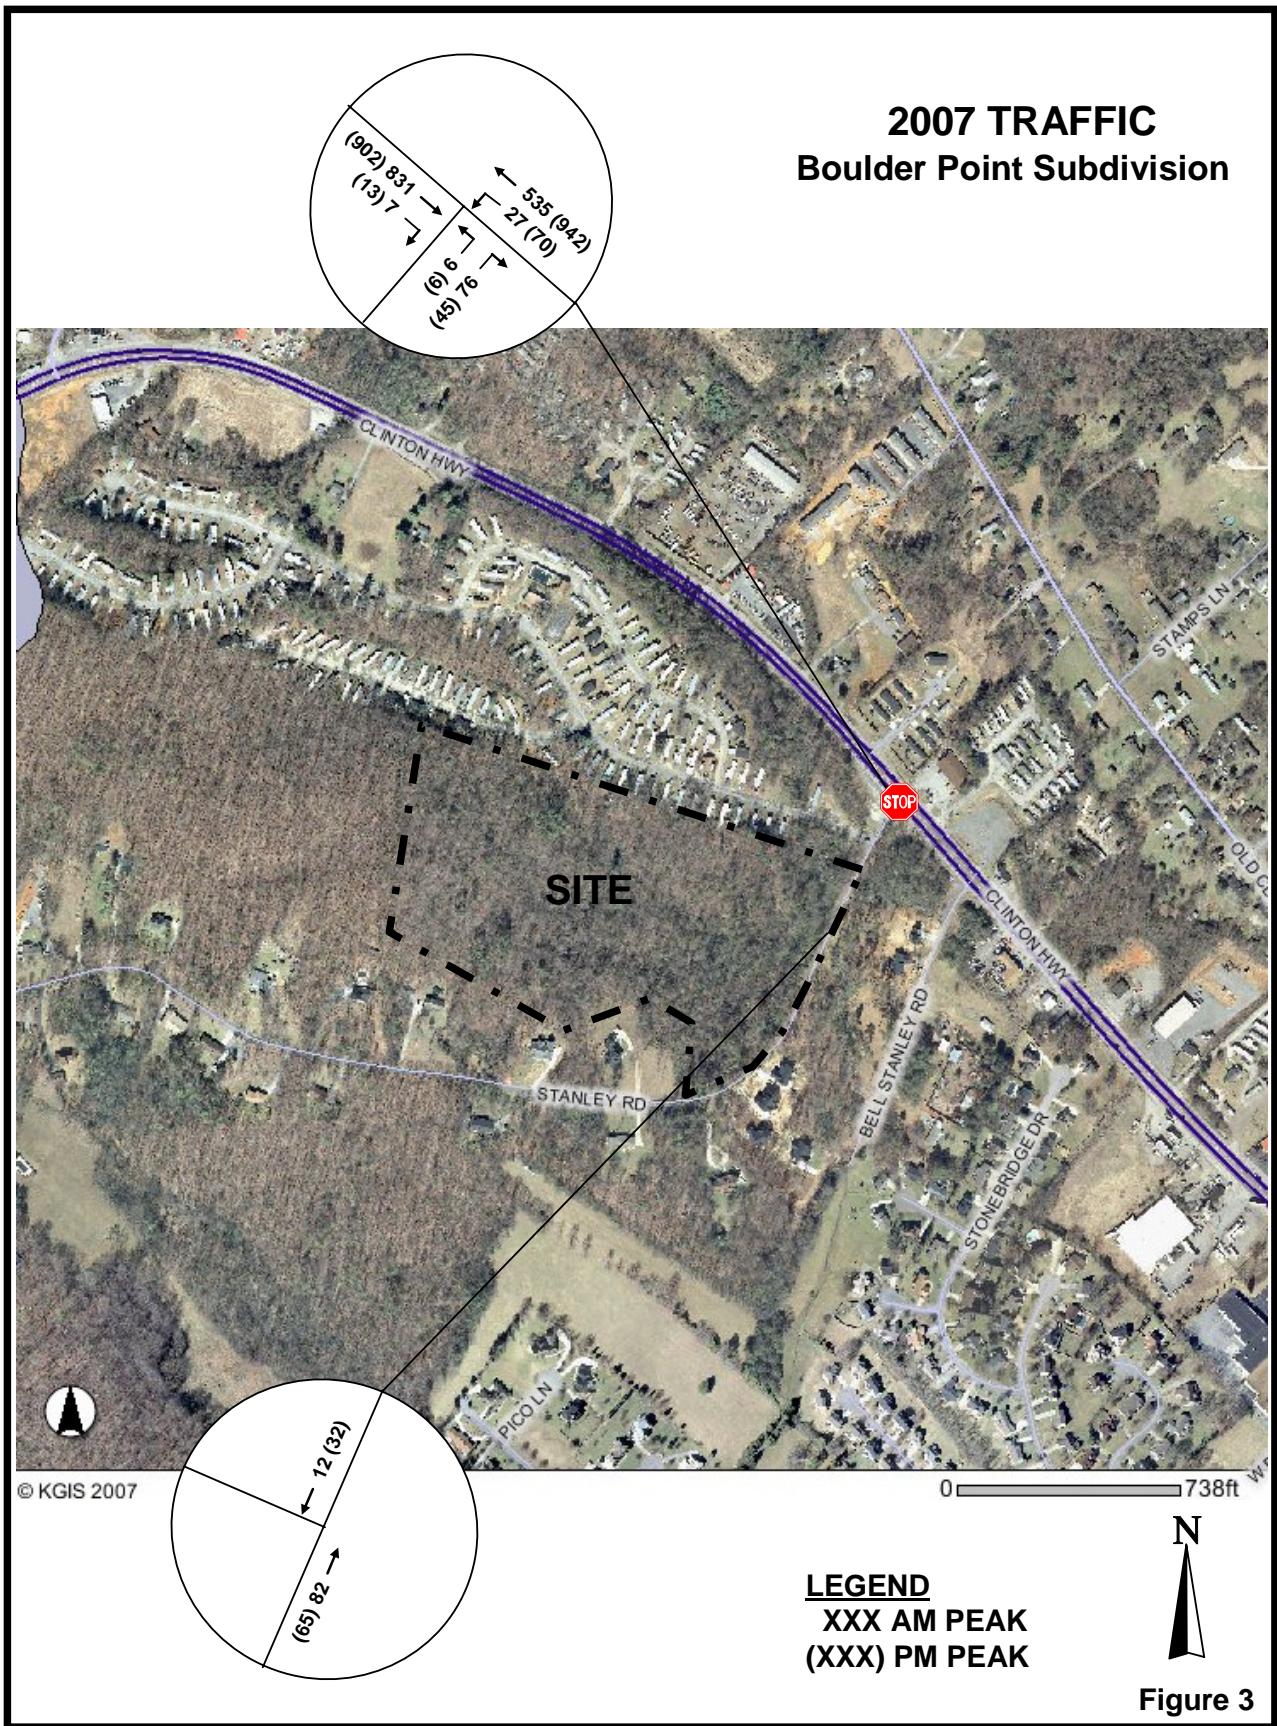

Table 1
LEVEL-OF-SERVICE (LOS) DESCRIPTION
FOR TWO-WAY STOP INTERSECTIONS

Level of Service	Average Control Delay per Vehicle (seconds)
A	≤ 10.0
B	> 10.0 and ≤ 15.0
C	> 15.0 and ≤ 25.0
D	> 25.0 and ≤ 35.0
E	> 35.0 and ≤ 50.0
F	> 50.0

SOURCE: Highway Capacity Manual, TRB Special Report 209

Analyses were conducted using the Synchro Software, developed by Trafficware. The analyses conducted found that the study intersections currently operate at a minimum LOS of a C with STOP control. Table 2 presents the capacity and levels of service for the study intersections.

Table 2

Clinton Hwy (US 25W) & Stanley Road	STOP EB	AM PM	0.15 0.09	13.9 17.6	B C

NOTE: Delay estimated in seconds.

BACKGROUND TRAFFIC CONDITIONS

Background traffic is traffic that can be anticipated regardless of the proposed development. Traffic within the study area should continue to grow due to other development as well as the continued growth through the study area. This background traffic is projected for the purpose of establishing a baseline.

Background Traffic Volumes

Historical traffic data is reviewed to determine traffic growth trends in the study area. Using the MPC count station on Clinton Highway, the annual growth rate was determined to be 0.92-percent over the past 23 years. For the purpose of this study, background traffic volumes were developed assuming an annual compounded growth rate of 2.5-percent. Background traffic is projected for the year 2010, a 7.7-percent growth in the adjacent street traffic volume. Build-out of the site is planned in the next few years. Actual build-out, however, will depend largely on the housing market.

Figure 4 presents the resulting Year 2010 AM and PM peak-hour traffic volumes without the proposed development.

Background Capacity and Level of Service

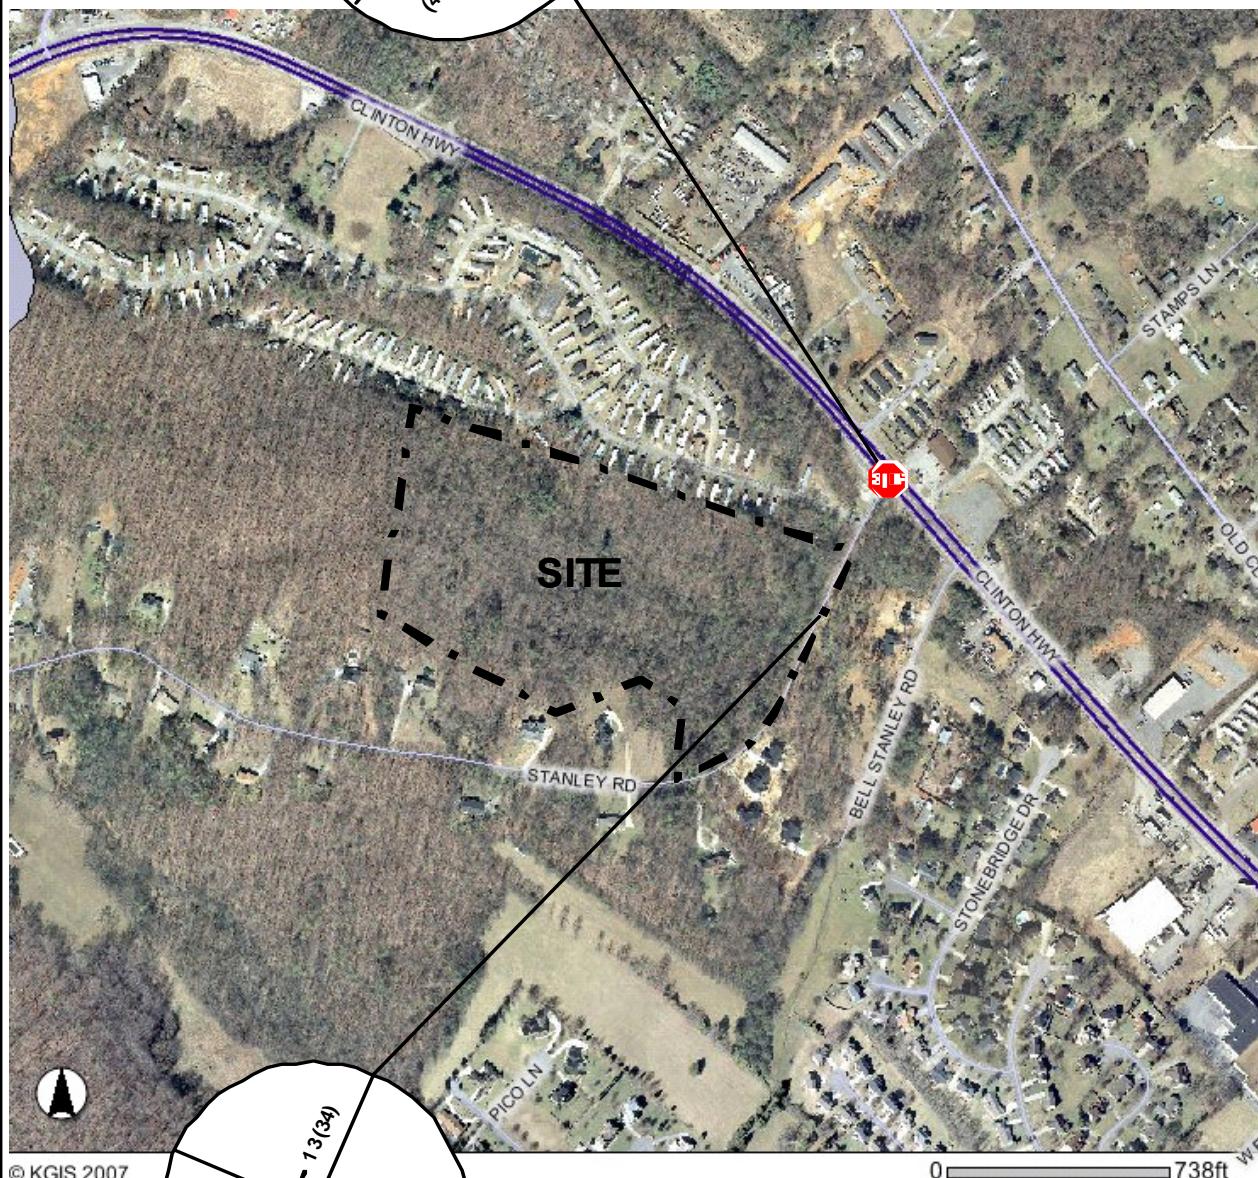

Analysis was performed with the grown traffic volumes and is presented in Table 3. The levels of service are measured to be acceptable for the unsignalized study intersection of Clinton Highway and Stanley Road with background conditions.

(XXX) PM PEAK

Figure 4

PROJECT IMPACTS

Project conditions are developed by generating traffic based on the proposed land use, distributing the trips to the transportation network, and again conducting analyses for capacity and level of service.

Trip Generation

Project traffic was determined using the publication, **Trip Generation, 7th Edition**. This reference is published by the Institute of Transportation Engineers (ITE) and represents national data collected for many different land uses including industrial, residential and commercial uses. **Trip Generation** is an essential tool in calculating the traffic, which may be generated by a proposed development. The study will generate traffic for 75 single-family units. From the trip generation calculations, the proposed site may generate approximately 800 daily trips. Table 4 presents the trip generation of this proposed site.

Table 4
TRIP GENERATION

Land Use	Land-Use Code	Units	Daily Trips	AM Peak-Hour Trips		PM Peak-Hour Trips	
				Enter	Exit	Enter	Exit
Single-Family	210	75	798	15	46	53	30

Reference: **Trip Generation, 7th Edition**

Trip Distribution and Assignment

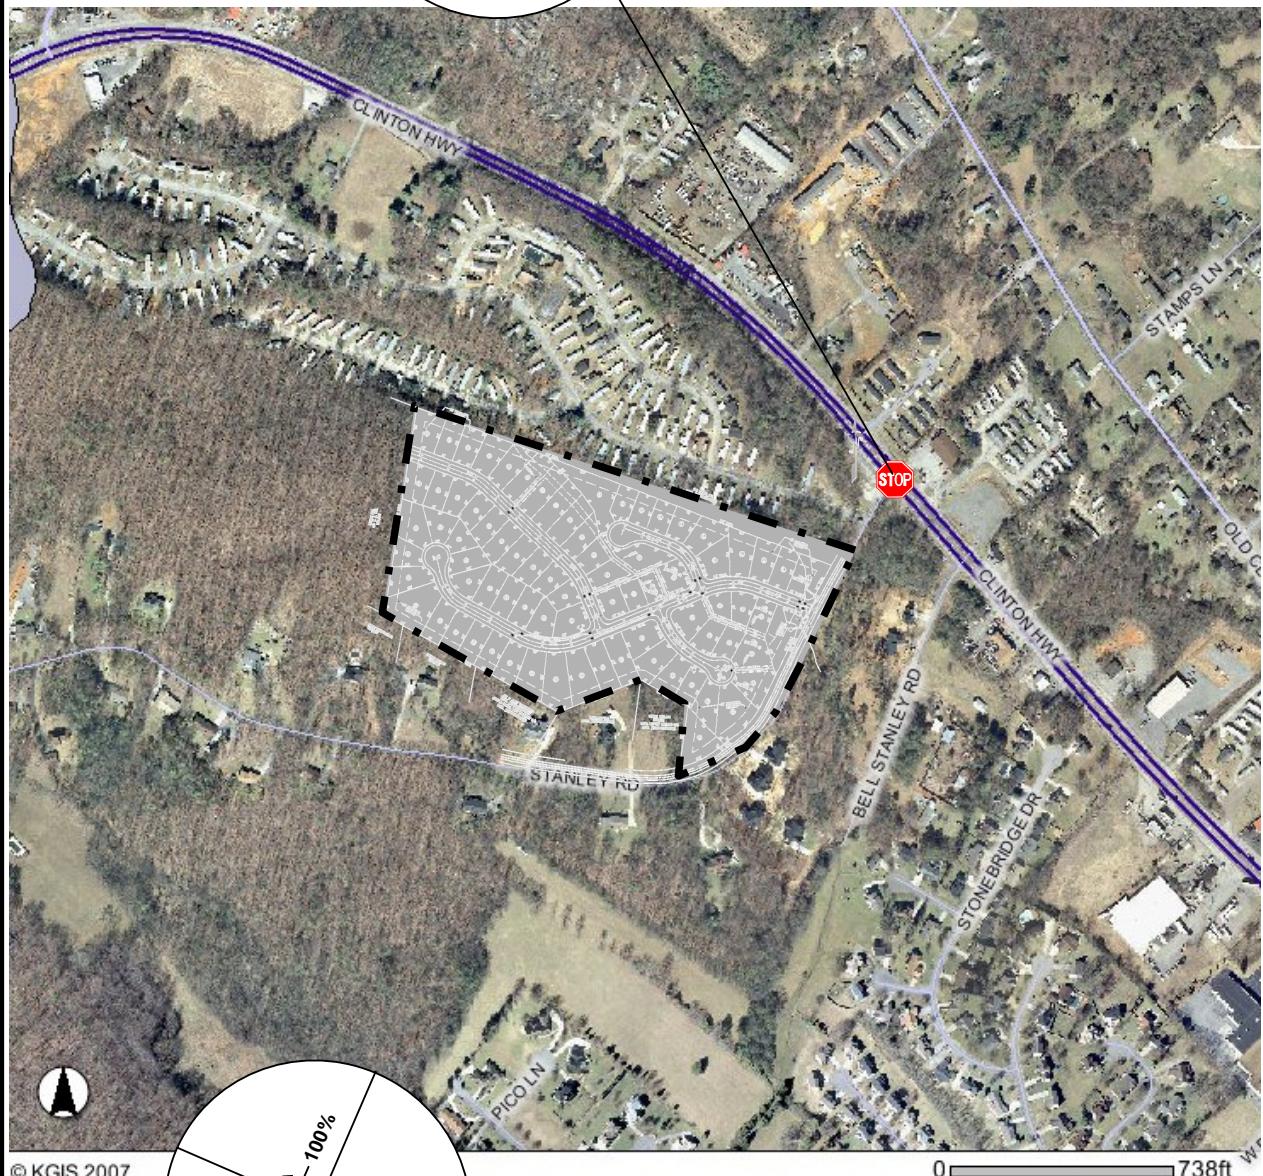

Using the TMC conducted for Clinton Highway and Stanley Road, residential development characteristics, and the local and regional roadway network, generated trips are distributed to Clinton Highway with 10-percent distributed to the north and 90-percent to the south during the AM and PM peak hours. Figure 5 illustrates this distribution and assignment.

Project Traffic Volumes

By multiplying the trips generated by the distribution percentages, the project traffic volumes are determined. Figure 6 illustrates the resulting project traffic volumes associated with the proposed project.

Figure 6

Total Projected Traffic Volumes

Background and project traffic volumes were added together to develop post-development traffic volumes for the year 2010. Figure 7 illustrates this 2010 projection. Using these projections, mitigation measures including traffic control devices and roadway and intersection geometry can be evaluated. The requirements of left- and right-turn lanes were evaluated using the criteria adopted by the MPC.

Auxiliary Lane Evaluation

Using the Knox County policy for turn lane requirements, found in the Knox County's **Access Control and Driveway Design Policy**, projected traffic volumes for the proposed street were evaluated for the need to provide auxiliary lanes. The Knox County policy for left-turn lanes is based on the **Highway Research Record** report titled, *Volume Warrants for Left-turn Storage Lanes at Unsignalized Grade Intersections*, by M.D. Harmelink, and an extrapolation of that report by Knox County. The evaluation indicates that left- or right- turn lanes are not necessary. The anticipated left-turn volume is nominal with an opposing traffic volume less than 100. A left-turning volume of less than 300vph would not require a left-turn lane. The right-turn volume from Stanley Road to the proposed street is 53vph and the advancing through traffic flow is less than 100vph; therefore, a right-turn lane is not warranted using the Knox County criteria.

Projected Capacity and Level of Service

The development of the site has an insignificant impact on the proposed intersection with Stanley Road and the intersection of Stanley Road with Clinton Highway. The development of 75 single-family units is presented in Table 5, and a summary is provided in Table 6. Results conclude that the study intersections would operate at a very acceptable level of service for projected traffic volumes.

Figure 7

Sight Distance

The project is proposed to access Stanley Road, which has a posted speed limit of 30mph. Sight distance was measured using the criteria published by the American Association of State Highway and Transportation Officials (AASHTO). Measured sight-distance for the proposed residential street at Stanley Road was measured to be approximately 300 feet to the east and approximately 550 to the west.

The speed limit of 30mph requires a minimum sight-distance of 200 feet to meet the minimum stopping sight-distance for AASHTO and 300 feet to meet the adopted Knox County minimum corner sight-distance standard. Therefore, the measured sight-distance is more than adequate for safe egress from the proposed development.

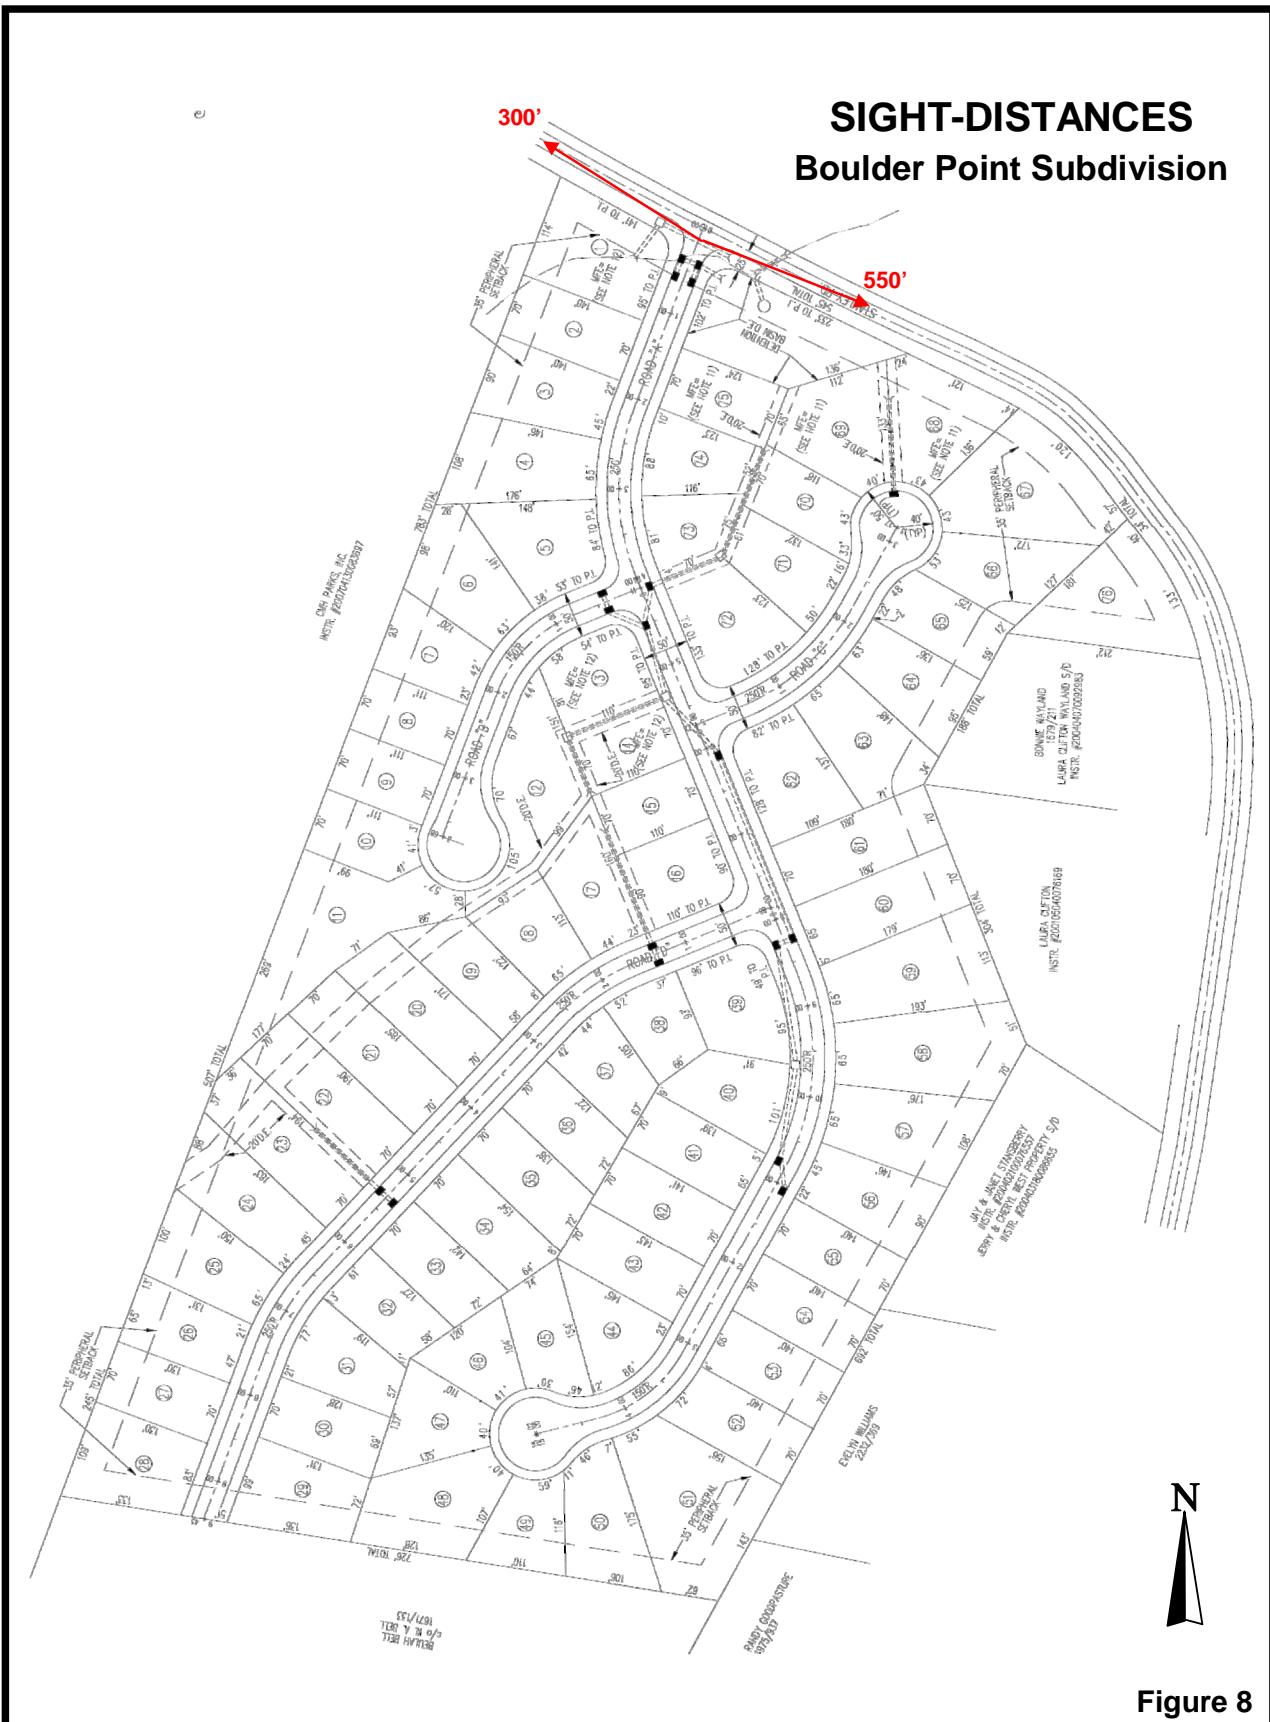

Figure 8

RECOMMENDATIONS

The analyses conducted and the review of the traffic volumes identified the following recommendations:

- Minimize landscaping, using low growing vegetation, and signing at the proposed street access to insure that safe sight distance is maintained.
- Use a minimum intersection radius of 30-foot for the efficient and safe ingress and egress of the site.
- Post STOP signs (R1-1) at the proposed residential street at Stanley Road.
- Intersection design should conform to the recommended standards and practices of the American Association of State Highway and Transportation Officials, the Institute of Transportation Engineers, and the Knox County Engineering and Public Works Department.

CONCLUSION

The study of this proposed residential development evaluated the projected traffic conditions. Background traffic was determined using a 7.7-percent annual compounded growth rate until the horizon year 2010. Traffic associated with the proposed project was then generated and distributed to the proposed site access. Using the identified turning movements for the projected traffic conditions, unsignalized and signalized capacity and level of service analyses were conducted using the **2000 Highway Capacity Manual**. Unsignalized levels of service are found to be acceptable for the projected traffic conditions. The evaluation of the sight-distance for the proposed intersection is found to exceed that required for a 30mph. An evaluation for the requirement of left- and right-turn lanes using the Knox County policy determined that auxiliary turn lanes would not be necessary for the projected traffic volume. Therefore, with the recommendations of this report, the efficient and safe flow of traffic should be maintained with the development of the proposed subdivision.
